

Info sheet

Waste valve "plane", suitable for HL shower tray drains series HL570 and HL520F

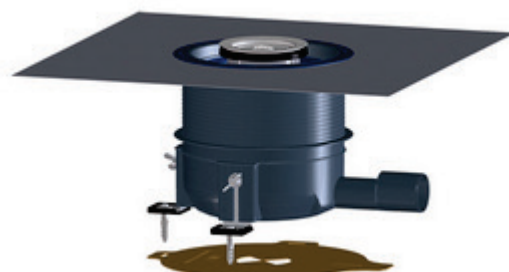

Fig.1

Fig.2

The new HL0570.7E waste valve has been specially developed for shower trays that do not comply with the standard specifications for the geometry of the drain opening according to EN 251. In detail, this concerns the cone of the drain opening, which is flatter in such trays.

In practice, such shower cups are not immediately recognizable to the installer at first glance. Only when the tray is connected to the waste fitting does it become apparent that the edge of the waste valve plate does not rest on the shower tray (see Fig. 2) and that there is no level connection in this area. The water can also not drain completely in this place. With the new waste valve HL0570.7E, which differs from the standard waste valve only in the angle between the valve plate and the threaded part, it is now possible to connect non-standard shower trays with HL drains safely and professionally (see Fig.1). The new waste valve is suitable for shower trays with drain opening of 90 mm and can be ordered individually or as a set under the following article numbers:

Waste valve with locknut in set **HL0570.1E-Plan**Waste valve **HL0570.7E-Plan****HL570.0-Plan** FlexBox with waste valve "plane"
